

- 1 - this button brings up the waveform for song 1
- + - this brings up both waveforms, splits the screen horizontally. Each song has separate controls
- 2 - this button brings up the waveform for song 2
- Flipper - switches from high pass to low pass
- X - clears the automation, brings song back to full EQ range

This screen provides EQ automations for the song. If it is a low pass filter, the area under the curve is colored. This means that the lower frequencies are played, and the higher ones are cut out. If it is high pass, the area above the curve is colored. This means the inverse. Having the whole screen colored implies normal play, but the X will clear the screen of color, also resulting in normal play.

The + button allows for automations to be done simultaneously.
